

Basic Healthy Home

A primary concern of health-conscious individuals is both the short-term and longer-term impacts of air and water pollution. At times, China's outdoor air pollution has exceeded levels set by the EU by over 30 times and stories of water source contamination have attracted substantial media attention. Homes frequently have high levels of indoor pollutants as a result of materials used in construction and decoration, and there are no legal requirements for a landlord to disclose the history of any previous issues the property may have had. As a result, tenants may be inheriting hidden sources of lead or other toxic chemicals. Conducting air and water quality testing is the only way to identify risks and ensure a safe home environment.

PureLiving has designed this testing package to give adult residents an audit of their home indoor air and water quality, as well as checking for conditions that can lead to mold growth. This package also includes a thorough inspection of any existing air purifiers and HVAC systems.

Please note, this package is less suitable for homes with young children – households where children are present would be better served by our Healthy Home testing package.

Basic Healthy Home package includes:

- English-speaking on-site home inspection and testing for common pollutants
- Test instruments are top-of-the-line calibrated equipment
- Full analysis in easy-to-understand format
- Personal debriefing with recommended solutions to address any shortcomings

Basic Healthy Home package description:
