

## Bringing Home Baby

The greatest concern of any new or expecting parent is the health and well-being of their precious infant. We want to know that they are protected from unnecessary risk, and that we are giving them a safe home where they are free from harm. Local air quality at times exceed levels set by the EU over 30 times, and poor quality of construction can allow outdoor air to 'leak' into the home. Regulatory protection can be difficult to enforce, causing homes to frequently have high levels of indoor pollutants.

Additionally, landlords are not legally required to disclose the history of a property. As a result, many homes may harbor hidden sources of mold, lead or other toxic chemicals. Conducting air and water quality testing is the only way to identify risks and ensure a safe home environment for your baby.

We have designed this inspection and testing package to give new or expecting parents a comprehensive audit of their home indoor air and water quality, as well as checking for possible sources of lead contamination and conditions that can lead to mold growth. The package also includes a thorough inspection of any existing air purifiers and HVAC systems.

You baby proof your home against physical dangers. Why not baby proof against hidden dangers of lead, mold, allergens, and chemicals like formaldehyde?

### Bringing Home Baby package includes:

- English-speaking on-site home inspection and testing for common pollutants
- Test instruments are top-of-the-line calibrated equipment
- Full analysis in easy-to-understand format
- Personal debriefing with recommended solutions to address any shortcomings

### Bringing Home Baby package description:
